Design Features

SPECIFICATIONS

Bore Sizes: 10" - 30"

Piston Rod Dia.: 4 1/2" - 14"

Pressure Ratings:

3,000 psi Nominal
Hydraulic Service

A. Heavy Duty Bolt-on Rod Cartridge

- Nitrided, bolt-on rod cartridge is pilot-fitted into the head and incorporates an outboard bearing design for maximum rod support and long life.

B. Rod Sealing System

- The normal high durometer, mechanically energized rod seal with a double lip rod wiper provides contamination exclusion and abrasion resistance to deliver exceptional performance and durability.
- Low friction and high temperature rod sealing systems are also available options.
- Metallic rod scraper is an available option for tough environmental conditions.

C. Secured Piston

- One piece, pilot-fitted, ductile iron piston is secured to the rod with anaerobic adhesive.
- Piston to rod set screw staking is an available option for high vibration applications.

D. Piston Sealing System

- Bi-directional, mechanically energized PTFE piston seal with outboard wearbands prevent pressure trap and protect against sidelading. Cast iron rings on the outer edges protect the primary seal from fluid contaminants and provide extended seal life.
- Low friction and high temperature piston sealing systems are also available options.

E. High Yield Piston Rod

- High yield, turned, ground, and polished microalloy steel with hard chrome plate is standard to protect the rod surface and provide long rod seal life.
- Thicker plating and alternate rod coatings and materials are available premium options.

F. Cushions

- Adjustable design allows for tuning for smooth deceleration and is available for all bore and rod combinations.
- Ball check design allows for smooth acceleration when coming out of cushion.

G. High Yield Steel Tubing

- High yield strength steel tubing is precision finished to provide extended piston seal life.
- Chrome-plated bores are available upon request.

H. Steel Heads and Caps

- Various robust mounting style options are available on either end to provide maximum design installation flexibility.
- A full range of ports are available to provide the broadest piping flexibility.

HGAS-10.00x088.13-N-04.50-2-N-P-R-1-1-1E-0

1, 2 Large Bore Cylinder

HG – 3000 psi Tie Rod

3, 4 Mounting Style

- AS – Side Lug
- JS – Head Square
- GS – Head Rectangular
- CF – Clevis
- SS – Cap Square
- PS – Cap Rectangular
- TT – Intermediate Trunnion
- WS – Cap Trunnion
- US – Head Trunnion
- HS – Centerline Lug
- NS – Cap End Extended Tie Rod
- MS – Head End Extended Tie Rod
- LS – Both Ends Extended Tie Rod
- KS – No Mount
- AD – Double Rod, Side Lug
- JD – Double Rod, Head Square
- GD – Double Rod, Head Rectangular
- TD – Double Rod, Intermediate Trunnion
- UD – Double Rod, Head Trunnion
- HD – Double Rod, Centerline Lug
- MD – Double Rod, Extended Tie Rod
- LD – Double Rod, Both Ends Extended Tie Rod
- KD – Double Rod, No Mount

5, 6, 7, 8 Bore

Specify in inches
(2 position decimal)

- 10.00 - 10" Dia. Bore
- 12.00 - 12" Dia. Bore
- 14.00 - 14" Dia. Bore
- 16.00 - 16" Dia. Bore
- 18.00 - 18" Dia. Bore
- 20.00 - 20" Dia. Bore
- 24.00 - 24" Dia. Bore
- 30.00 - 30" Dia. Bore

9, 10, 11, 12, 13 Stroke

Specify length in inches
(3 positions to the left of decimal and 2 positions to the right). For example:

Code	Size
004.50	4.50
010.00	10
112.50	112.50 etc.

14 Cushions

- N - None
- B - Both Ends
- H - Head End
- C - Cap End

15, 16, 17, 18 Rod Diameter

Specify in inches
(2 position decimal)

- 04.50 - 4.5" Rod Dia.
- 05.00 - 5" Rod Dia.
- 05.50 - 5.5" Rod Dia.
- 07.00 - 7" Rod Dia.
- 08.00 - 8" Rod Dia.
- 09.00 - 9" Rod Dia.
- 10.00 - 10" Rod Dia.
- 11.00 - 11" Rod Dia.
- 14.00 - 14" Rod Dia.

19 Rod End Types

Code - Rod End Style

4 - Short Female UNF Thd

2 - Small Male UN Thd

5 - Plain No Attachment

1 - Intermediate Male UN Thd.

G - Grooved End

K - Extended Small Male UN Thd

M - Extended Int. Male UN Thd

20 Ports

For maximum reliability,
SAE ports are recommended.

Code - Port Style

N - NPTF

P - Oversize NPTF

S - SAE/UNF O-Ring

R - Undersize SAE/UNF O-Ring

F - SAE 4-Bolt Manifold

E - Undersize SAE 4-Bolt Manifold

21 - 22 Rod and Piston Seals

P-R - Normal Sealing System - Urethane Polypak Rod Seals, GFT seal with metallic rings Piston Seals

L-B - Low Friction Sealing System - Low Friction Polypak Rod Seals, GFT seal with wear band Piston Seals

F-V - High Temperature Sealing System - Viton Polypak Rod Seals, Viton GFT seal with metallic rings Piston Seals

23, 24 Port Locations

1-4 - Head End Position

1-4 - Cap End Position

Standard Cylinders

Eaton has created an easy system for ordering Hydro-Line® HG Series cylinders. This system has been developed to improve our service to you. The model code consists of alpha-numeric digits which fully describe the most common standard options offered on HG Series cylinders.

To specify your HG Series cylinder, review the following pages for a full description of each option available and select the desired code.

This model code system will:

- **Simplify the re-order process**

Each Hydro-Line cylinder is assigned a model code. That code is unique to a particular cylinder description. That way, when you re-order your Series HG cylinder, you're assured of exactly the same top quality cylinder design.

- **Improve identification**

Every cylinder has its model code clearly marked on the product. Each code completely describes a specific cylinder. This allows seals and replacement components to be easily identified in the field.

- **Facilitate communications**

This fully descriptive model code system allows you to work directly with your local Eaton sales engineer to identify and service your Hydro-Line cylinder.

Note: See pages 4 and 5 for a summary of model code options.

Custom Cylinders

New Cylinders

Although the model code has been arranged to cover the vast majority of available options, there will be occasions when you require an option which cannot be coded. When specifying such an option, enter an "X" for the appropriate item in the model code, then describe your requirements.

For example, if you have an application which requires a custom thread on the end of the piston rod, enter an "X" for the item. Then add a full description at the end of the model code, such as "With 3.25 inch total rod projection and M22 x 1.5 thread 1.375 inches long." The cylinder will then be given a unique six digit design number on receipt of order (as explained in next section).

Replacement Cylinders

Every custom Hydro-Line cylinder is assigned a unique design number. A custom cylinder will have 32 digits vs. 27 for the standard cylinder. The design number is contained in the last six digits of the model code, and item 27 is always an alpha character. In other words, the design number begins where the 'X' is placed in position 27 when first specifying the custom cylinder. When ordering a replacement cylinder, simply give the model code or the six digit design number to your local Hydro-Line cylinder sales representative.

Replacement Parts

Each design number is stored in a quick retrieval computerized storage system. This gives our field sales representatives rapid access to assist you in identifying and specifying genuine Hydro-Line replacement parts.

Mounting Style and Installation Dimensions

Mounting Application Guide

Side Lug Mount

- Side lug mounts are for moving loads along a flat guided surface, as in a carriage along rails.
- The mounting surface should be flat and parallel to the centerline of the piston rod.
- The load should be guided to traverse along the centerline of the piston rod.
- With unsupported loads, the bearing must absorb more force. For these applications, the larger alternate rod is recommended and stop tubes should be considered.
- The frame on which the cylinder is mounted must be sufficiently rigid to resist bending moments.
- Use high tensile socket head cap screws or hex head bolts tightened to the manufacturer's recommended torque.
- For high shock applications, dowel pins or shear keys should be incorporated in the mounting design.
- For severe side load applications, consult your local Eaton sales engineer.

Full Thickness Head Mount

- These mounts are ideal for straight line force transfer applications in which the cylinder is used in tension (pulling) as in pull presses. For compression applications (pushing), a cap rectangular / square mount is more appropriate.
- The mounting surface should be flat and the head bearing should be piloted into it.
- The force of the load should be perpendicular to the mounting surface and parallel the centerline of the piston rod. For eccentric loads, the oversize alternate rod is recommended and stop tubes should be considered.
- The frame on which the cylinder is mounted must be sufficiently rigid to resist bending moments.
- Use high tensile socket head cap screws or hex head bolts tightened to the manufacturer's recommended torque.

Clevis Mount

- This mount is for applications in which the machine member travels in a curved path within one plane.
- This mount can be used both in compression (push) and tension (pull). Care must be exercised to prevent rod buckling in compression applications with long strokes. See page 49 for stroke limitations.
- The centerline of the machine member that attaches to the swivel pin must be perpendicular to the center-line of the piston rod and the curved path must be in one plane only. Any misalignment will cause excess side loading on the bearing and piston. This will lead to premature failure.

Mounting Style and Installation Dimensions

Mounting Application Guide

Head and Cap Trunnion Mounts

- These mounts are for applications in which the machine member travels in a curved path within one plane.
- Either mount can be used both in compression (push) and tension (pull) applications. head trunnion mounts provide a longer maximum stroke than cap trunnion mounts, when used in compression.
- The trunnion pins are an integral part of the head and can be sleeved to provide an extremely tight fit to the mating machine member and permit curvilinear motion.
- It is recommended that rigidly mounted pillow blocks with bearings at least as long as the trunnion pins be used and be installed as close to the shoulder of the trunnion as possible.

Extended Tie Rod Mounts

- These mounts are for straight line force transfer applications. The head end extended tie rod mount is recommended for tension (pulling) applications and the cap end extended tie rod mount is recommended for compression (pushing) applications. Both ends extended tie rod mounts are suited for tension and compression applications or applications where additional hardware is to be attached to the cylinders.
- The mounting surface should be flat and the frame on which the cylinder is mounted must be sufficiently rigid to resist bending moments.
- On head mount applications, the bearing provides a pilot diameter to align the rod in the mounting frame.
- Once fitted into the application framework, the nuts which are provided should be torqued to the values listed on page 48. On some Both ends extended tie rod mounts, the nuts must be loosened on the head then torqued following assembly to the framework.
- The force on the rod should be perpendicular to the mounting surface and coincide with the centerline of the piston rod. For eccentric loads, oversized alternate rods are recommended and stop tubes should be considered.

Double Head Mounts

- Double rod end cylinders are specified when equal displacement is desired on both sides of the piston or when the application is such that another function can be performed simultaneously with a second rod.
- The single rod mount application data is applicable for all double head cylinders.

NOTES:

- 1) Dimensions shown are supplement to single rod end cylinders.
- 2) If only one end cushioning is required, clearly indicate which is required.
- 3) Mount offerings and pressure ratings remain same as single rod cylinders.
- 4)† Use screws 1/16" smaller than mounting holes.

Common Options

Rod End Selection

In addition to selecting the correct bore, you must specify the appropriate rod size and rod end configuration for your application.

Seven different inch rod end configurations are available. If a custom design is required, contact your local Eaton Hydro-Line sales engineer, and we will build to your requirements.

The table on page 49 gives maximum allowable length between the mounting points at various operating pressures for available rod diameters of Series HG cylinders.

Rod ends on rigid mount cylinders should be supported. Longer strokes are allowable for pull only applications. Contact your local Eaton Hydro-Line sales engineer for application assistance if necessary.

Port and Cushion Selection

Port and cushion locations are identified by viewing the cylinder from the head end (or from the mounting end of double rod cylinder). The location numbers are shown to the right.

Certain port and cushion locations cannot be specified with some mounting styles. The table below indicates which of the head and cap port locations are available for each Series HG mounting style.

1. The load is maximum load in tension
2. The pull load of the cylinder should be less than the listed load for the respective selected rod accessory.
3. Pivot pin is rated in shear.
4. All rod accessories must be torqued against rod shoulder.

Mounting Accessories

Self-Aligning Coupler

Lateral movement (on push only) and radial movement provide precision alignment between cylinder and machine. Couplers preset with proper clearances and completely lubricated at factory before shipping.

Self-aligning Coupler

Note

When ordering oversize and 2:1 rod cylinders, specify modification to suit standard rod diameter's coupler.

Self-aligning Rod End Coupler

▲ Four 1/2" diameter x 1/2" deep spanner holes instead of flats.

Mounting Accessories

Grooved Rod End Coupling

Used with the Hydro-Line style G rod end, the rod end coupling provides for close lateral alignment between the rod end and machine member.

The two-piece steel coupling features high tensile strength socket head cap screws (with safety factor designed to take full load), permits quick assembly / disassembly for fast and easy installation and servicing.

To order C-271- and C-272- as an assembly, sue part no. C-275-.

Application/ Engineering Data

Stop Tube Selection

As the stroke length of a cylinder increases, the resultant bearing loads on the piston rod becomes greater. To keep these bearing loads from exceeding design limitations and to obtain optimum life from a cylinder, stop tubes should be specified according to the following procedures:

Specify one inch of stop tube for each 10 inches (or fractions thereof) of stroke in excess of the maximums listed in the table below.

Stop Tube Designs

Three typical stop tube designs are illustrated here.

Design A (Stop Tube)

Used for cylinders non-cushioned on the rod

Design B (Stop Spacer)

Used for cushioned cylinders

Design C (Double Piston with Spacer)

The best choice for a cylinder with an exceptionally long stop tube requirement

Note that piston's effective bearing area is doubled, in addition to gaining the normal increased minimum distance between bearing points

Maximum Stroke Permissible without Stop Tube

BORE	PIVOT MOUNT CYLINDER (CLEVIS & TRUNNION)	RIGID MOUNT CYLINDERS (WITHOUT ROD SUPPORT)	RIGID MOUNT CYLINDERS (WITH ROD SUPPORT)
10.00 to 14.00	36 inch	40 inch	48 inch
16.00 and Above	Consult factory		

Application/ Engineering Data

Tie Rod Spacer Selection

Tie rod spacers and center supports are used to improve the structural rigidity of long stroke tie rod cylinders. A tie rod spacer or center support should be applied when the stroke length exceeds 20 times the bore diameter.

Tie Rod Spacer

The spacers have through holes for the tie rods and are held in place on the cylinder barrel with a small tack weld or set screw. The spacers keeps the tie rod in the proper position around the centerline of the cylinder and acts much like a truss in preventing excessive deflection in a long stroke cylinder that is not rigidly mounted (Clevis mount etc.).

Tie Rod Center Support

The center support has side mounting lugs similar to side lug mount heads and serves as an additional mounting location. The tie rods are studded in to the center support and it becomes a load carrying component of the cylinder assembly. The exact location of the tie rod center support is generally optional, which greatly increases the flexibility in mounting a long stroke cylinder.

PS200 Proximity Switches

PS200 proximity switches for Series HG cylinders are an inductive type switch with a sensing probe that "looks" at the cushion collar or button providing full extend or full retract indication. Since the probe is in the cylinder,

harsh, external environments do not affect sensing.

The 2-wire circuit will operate on AC and DC. It operates as reliable as a programmable controller.

PS200 proximity switches meet UL requirements for 3000 psi hydraulic cylinders.

Short circuit protection is a standard feature on the PS200 proximity switch. SCP protects the switch from shorts in the load or line. Upon sensing a short condition the switch assumes a non-conducting mode.

The fault condition must be removed and power turned off to reset, preventing automatic restarts.

Indication of switch in SCP mode is both LED's flashing.

Pressure	3000 psi/5000 psi Non-shock
Sensing Range	0.08" ±10%
Operating Temperature Range	-20° to 70° C
Repeatability	.001"
Switching Differential	20-220V AC/DC
"On-State" Voltage Drop	10V @ 5-500mA
Load Current Maximum	0.5 Amp
Inrush Current	3 Amp
Quiescent Current	1.7 mA Maximum
Indicating LED's standard	1] Power On/Non-conducting 2] Target present (both flashing = SCP mode)

Note:

- 1) 1/4-20 mounting screws to be torqued to 12 to 15 Ft-Lbs
- 2) O-rings required
(1) Size -- 115 per switch
(2) Size -- 116 per spacer

Application/ Engineering Data

Limit Switches (Available up to 14" Bore)

Two different limit switches are available. Both switches come with a 1/2" pipe conduit connection in the enclosure wall. Switches 01 and 03 are available with quick disconnect plug factory-wired to the limit switch as an option.

SWITCH '01' SINGLE POLE, DOUBLE THROW (STANDARD)

15 Amperes	125 Volts AC

Note: Recommended torque values using
MoS2 lubricant with .12 coefficient of friction.

*NPTF and BSPP ports are not recommended for maximum reliability on new applications.

Application/ Engineering Data

Buckling Chart

Buckling Chart

Maximum allowable length 'L' in full extend condition.

In push applications, a cylinder acts as a loaded column. To use the table below, first go to the section for your mounting style. Then locate the column with pressure which is closest to, but not below, your application's operating pressure. The intersection of operating pressure

and the bore / rod size represents the maximum allowable length 'L' in full extend condition. This maximum length is based on column loading analysis only and does not consider side loading, stop tube requirements, or other cylinder stroke limiter.

For pressures above 3000 psi, consult your local Eaton Hydro-Line representative.

MAXIMUM LENGTH L (IN) AT WORKING PRESSURE (PSI) - Length L in full extend condition

BORE Ø	ROD Ø	Rigid Mount Styles 01, 09, 14							Swivel Mount Styles 10, 15						
		3000 psi	2000 psi	1500 psi	1000 psi	750 psi	500 psi	250 psi	3000 psi	2000 psi	1500 psi	1000 psi	750 psi	500 psi	250 psi

Formulas

Calculation according to Euler

$$P = \frac{C\pi^2 EI}{FL^2} \quad \frac{L}{k} > \left[\frac{2C\pi^2 E}{S_y} \right]$$

Calculation according to Jb Johnson

$$P = \frac{AS_y}{F} \left[1 - \frac{S_y L^2}{4C\pi^2 Ek^2} \right] \quad \frac{L}{k} \leq \left[\frac{2C\pi^2 E}{S_y} \right]$$

End conditions for above chart:

Mount	Condition
01,09,14	Fixed-Guided
10,15	Pin-Pin

F Safety factor, 3.5 up to 10.00 inch rod.
3.00 for 11.00 and 14.00

P Critical load, Lb

E Modulus of elasticity, 30,000,000 psi

L Length, in

I Moment of inertia, in⁴

C End condition

Fixed-Guided 2

Fixed-Fixed 4

Pin-Pin 1

A Rod area, in²

k Radius of gyration, in
